Free yourself from the never ending infrastructure management and maintenance burdens by migrating your servers to the secure and reliable CloudRivo cloud!

Worry-free migration of your physical and virtual servers to the cloud:

CloudRivo cloud migration service is perfect if you:

- Want to move existing on-premise servers to the cloud but you're not sure where to begin
- Aren't happy with your current cloud services provider
- Aren't sure if you want to move to the cloud, but would like to try it

CloudRivo cloud migration service provides easy migration of your existing cloud based or on-premise servers into the CloudRivo cloud. And the best part of the process is that you continue to use your source servers during the data migration process!

Simple and rapid cloud onboarding through automation:

- CloudMigrate is an advanced agentless migration solution that automates the collection, re-packaging, conversion and deployment of server images and their associated metadata/configuration into cloud and virtual environments.
- Workload migration is automated and doesn't require any pre-processing on your source servers or post-processing on the target servers.
- Migration can occur between heterogeneous environments, including migration from one hypervisor platform to another, and even across clouds.

Migration flexibility and simplicity:

- There's no hardware or software to procure, maintain or manage.
- Operating Systems supported:
 - Microsoft Windows Server 2003 / 2008 / 2012
 - All major Linux distributions
- Source servers:
 - Virtual and physical (V2V and P2V) migration
 - On-premise or hosted in another location
 - Public clouds: Amazon AWS, Microsoft Azure, VMware vCloud Air
- Migration destination choices:
 - USA: Ashburn, VA., Boston, MA., San Jose, CA.
 - Ireland: Dublin, Japan: Tokyo
 - Canada (coming soon)
 - United Kingdom: London (coming soon)

Migration Flexibility and Simplicity:

- There's no hardware or software to procure, maintain or manage.
- We'll work with you to prepare your source and destination servers for migration.
- Once preparations are complete, you select when you're ready to move. CloudMigrate synchronizes with your source servers one final time and updates the target (cloud) servers with the latest state of your source servers. You are then free to "Flip the Switch" to activate your cloud servers.

Why Migrating To A CloudRivo Cloud Is A Better Choice:

- The support you need: We're with you throughout the whole migration process from planning to activation of your cloud servers, and beyond. You focus on your business and leave the rest to us.
- Local risk elimination: You select the destination location from a list of global datacenters. Running your servers in our cloud improves availability and can mitigate any local risks your location might be exposed to.
- Secure facilities: Your servers are migrated over secure network connections to one of our enterprise class, state-of-art, highly secure datacenters. Redundant infrastructure and networking components ensure you experience high levels of data availability and accessibility.
- Server monitoring: We provide 24x7x365 monitoring and management of your cloud servers to pro-actively address any issues that may arise.
- For additional peace-of-mind you can leverage one, or both of our business continuity services: Backup-as-a-Service (BaaS) and Disaster-recovery-as-a-Service (DRaaS).

About CloudRivo

CloudRivo launched its cloud services business with the introduction of Xterity Cloud Services. This intuitive cloud services business management platform greatly simplifies cloud service provider workflow processes including design, deployment, management, pricing, margin analysis, and billing enabling you to rapidly add lucrative cloud services to your portfolio.
