CloudRivo's Xterity Enterprise Cloud

A secure and reliable cloud service for hosting all of your applications, delivered by your local provider

CloudRivo's Enterprise Cloud offering provides the secure, highly available Infrastructure as a Service (IaaS) environment you need for all of your applications. Instead of a one-size-fits-all cloud service, our Enterprise Cloud service was designed to support the full range of IT and business applications from test, development and less-demanding environments to complex, multi-tier and mission-critical applications.

Choosing cloud services from CloudRivo also provides other benefits you can't get elsewhere:

Cloud Planning and Onboarding Services

With our experience and expertise in helping clients move to the cloud, we can provide the help you need to move your applications from on-premise environments to the cloud.

Customized IT Environments

Our flexible, powerful cloud provisioning system lets us quickly create exactly the right environment for each application. While other cloud services only support virtual servers, the Enterprise Cloud includes the ability to configure and deploy both virtual and physical servers, with unmatched flexibility to assemble exactly the computing resources you need. This is ideal in a database environment, for example, with a database running on physical dedicated servers

and virtual machines as public-facing Web servers.

Enterprise-Class Availability

Many of your applications require the highest levels of availability—which CloudRivo delivers with high availability failover for both virtual and physical servers. Our high-availability is provided at both the virtualization layer (HA cluster) and the hardware layer, ensuring your applications are always protected.

With our Enterprise Cloud offering there is no need for expensive clustering software or additional servers, hypervisors or application licenses for the failover server.

Real Time Monitoring and Support

Our service includes a comprehensive management and monitoring systems that enables you to monitor SLA compliance, IT policy execution and alerting for any technical issues as well as status of services including backups. Clients can access the portal for information regarding your environments.

Local, Personal Support

Have you ever tried to speak to a real person at one of the major cloud service providers?

As a local provider focused on customer service, we pride ourselves on delivering the support and services users need.

## Fast, Flexible Service Provisioning

The Enterprise Cloud service is powered by Xterity Cloud Services, whose cloud management, orchestration and provisioning system enables fast configuration and deployment of customized IT environments. With the online service catalog and the associated design palette, IT services are created by simply dragging, dropping and connecting all the components of the desired IT service. These IT environments are networked groups of related systems and business applications in the cloud, similar to traditional on-premises IT configurations.

Complete application environments can also be defined with the Xterity templating capability. Once a design is complete application solutions can be immediately deployed with the click of a mouse.

World Class Datacenters

The Enterprise Cloud is hosted in Equinix Tier 3/4 datacenters that are designed, built and operated to meet the highest standards worldwide and meet end customer performance and security requirements.

Cloud infrastructure has been placed in datacenters around the world so that applications can run in nearby regional networks to ensure that latency and data residency needs are met.
