

CloudRivo's Xterity Hybrid Cloud

Seamless integration of private and public cloud resources

An increasing number of organizations are choosing to implement a multi-cloud model, with services being consumed from both private and public cloud infrastructure. What's driving this adoption? The same factors driving the adoption of cloud overall: cost savings, in-house skills shortages, the need to augment in house resources and faster access to computing resources.

With **CLOUDRIVO'S** multi-cloud orchestration, services can be provided from both the **CLOUDRIVO** cloud and public clouds using a single, easy to use catalog.

This lets you run your applications where they best fit without the complexity of managing multiple services and vendors.

Fast, Flexible Service Provisioning

The **CLOUDRIVO** Cloud service is powered by Xterity Cloud Services, whose cloud management, orchestration and provisioning system enables fast configuration and deployment of customized IT environments.

All of the datacenter resources and services can be represented in software and selectable from the portal

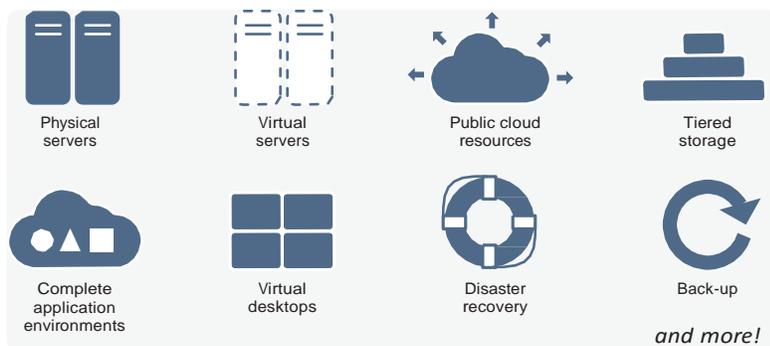

With the online service catalog and the associated design palette, IT services are created by simply dragging, dropping and connecting all the components of the desired IT service.

These IT environments are networked groups of related systems and business applications in the cloud, similar to traditional on-premises IT configurations.

Complete application environments can also be defined with the Xterity templating capability. Once a design is complete application solutions can be immediately deployed with the click of a mouse.

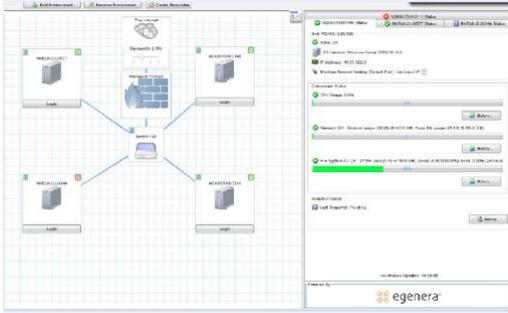

Local, Personal Support

Have you ever tried to speak to a real person at one of the major cloud service providers? As a local provider focused on customer service, we pride ourselves on delivering the support and services users need.

Real Time Monitoring and Support

Our service includes a comprehensive management and monitoring systems

World Class Datacenters

The **CLOUDRIVO** cloud services are hosted in Equinix Tier 3/4 datacenters that are designed, built and operated to meet the highest standards worldwide and meet customer performance and security requirements.

Cloud infrastructure has been placed in datacenters around the world so that applications can run in nearby regional networks to ensure that latency and data residency needs are met.

that enables you to monitor SLA compliance, IT policy execution and alerting for any technical issues as well as status of services including backups. Clients can access the portal for information regarding your environments.
